June 16-20, 2014  
Pasadena, CA**

**Funded by NASA In-Space Propulsion Program**

# Multi-Mission System Analysis for Planetary EDL (M-SAPE)

# Motivation

- **Materials and systems for extreme environments have been identified by the Outer Planets Assessment Group (OPAG) as technology needs for future planetary probe missions [1-2]. One critical element of this system is the lightweight pressure vessel component suitable for missions in extreme environments, and this element is considered the highest priority for in situ exploration [2].**
- **Pauken et al. [3] provide an excellent overview of metallic and advanced composite material selections. They conclude that there is a potential for reducing the mass of a titanium baseline pressure vessel for a mission to a high pressure/temperature environment .**
- **Stackpoole and et al. [4] propose a nano-reinforced titanium concept as candidate material for pressure vessels. Samples processed by Stackpoole indicate that there is a potential for a lower mass alternative for pressure vessel materials with 10% mass reduction and more than 200% increase in higher specific modulus.**

NASA Flagship Mission to Venus

SAGE Lander

# Pioneer Venus

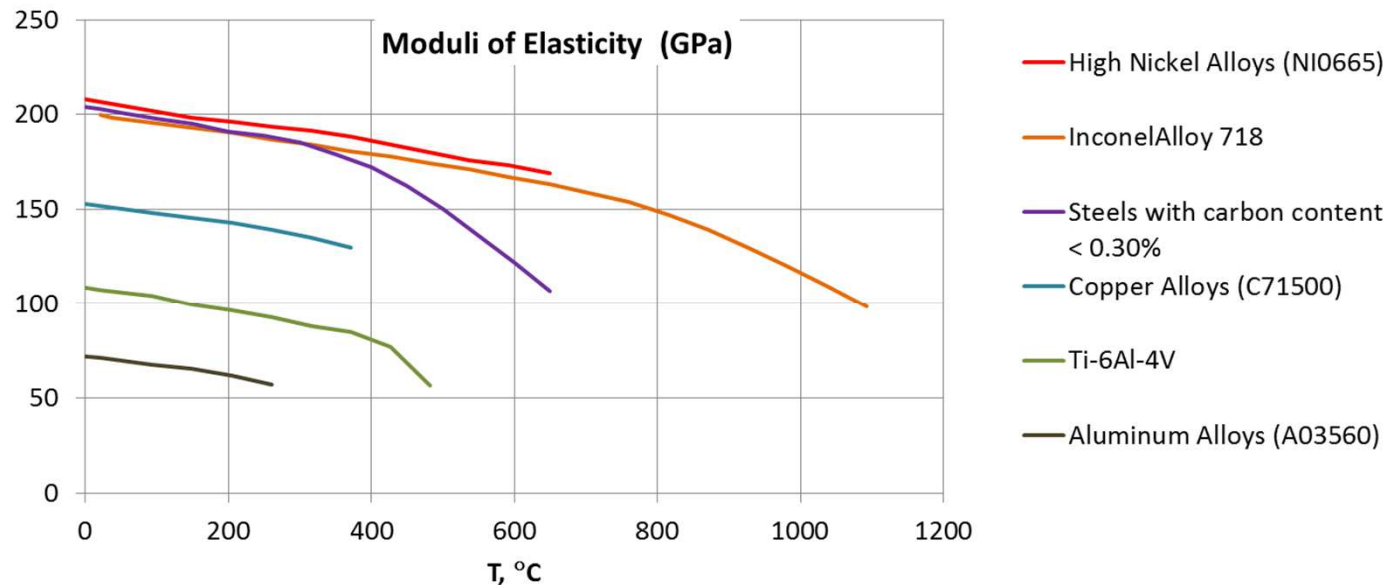

"Pioneer Venus Case Study in Spacecraft Design", Hughes Aircraft Company, AIAA, 1979

- All Pressure Vessels were essentially configured the same.
- Entry loads of 565 & 400 g's, for small and large probes.
- Titanium (6AL-4V) monocoque with solid beryllium shelves.
- Sized for the Venus surface condition (1400 psi & 920°F)
- Waffle pattern rib stiffened did not prove to be competitive
- Ports & windows (mechanical and thermal load paths)
- Factor of safety of 1.25 on pressure
- Knockdown factor, K (0.4-0.7, redesigned with 0.7)
- Design changed from externally insulated to internally insulated (K 0.7->0.5)

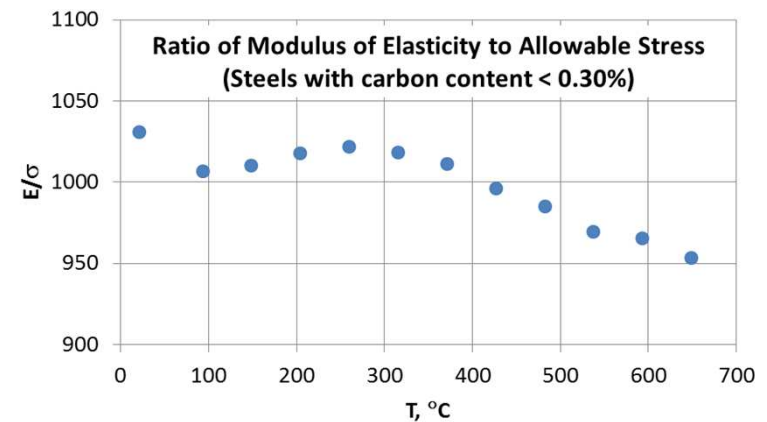

# Material Selection

(Addenda to ASME 831.1-2007 & MIL-HDBK-5H-1998)

$E/\rho$ (SI)	Materials
$1.9E+07$	High Nickel Alloys (NI0665)
$2.1E+07$	Inconel Alloy 718
$1.9E+07$	Steels with carbon content < 0.30%
$1.4E+07$	Copper Alloys (C71500) @370C
$1.7E+07$	Titanium
$2.1E+07$	Aluminum Alloys (A03560) at 200C

# Parametric Mass Model

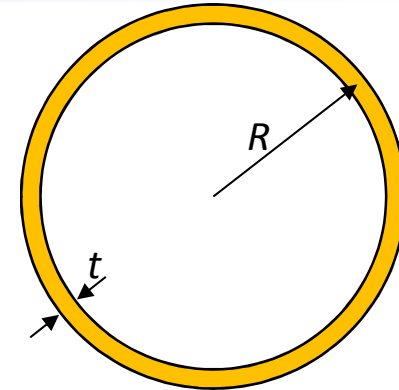

## (External Pressure)

Roark's Formulas for Vessels with External Pressure:

$$p = \frac{2}{\sqrt{3(1-\nu^2)}} E \left( \frac{t}{R} \right)^2, \text{ for ideal case}$$

$$p = 0.365 E \left( \frac{t}{R} \right)^2, \text{ recommended minimum } p$$

$$p = C E \left( \frac{t}{R} \right)^2, \text{ (Eq. 1) } C \text{ is a constant (either 0.365 or } \frac{2}{\sqrt{3(1-\nu^2)}})$$

Mass:

Mass =  $\rho$ . volume =  $\rho$ . A. t, (Eq. 2)  $\rho$  is density, A surface area

Substitute  $t$  from Eq. 1 into Eq. 2 and rearrange terms

$$\text{Mass} = \frac{3}{\sqrt{C}} \cdot \frac{4\pi}{3} R^3 \frac{\sqrt{p}}{\left( \frac{\sqrt{E}}{\rho} \right)} \leftarrow \begin{array}{l} \text{Environment} \\ \text{Material} \end{array}$$

Geometry

Vessel with Internal Pressure

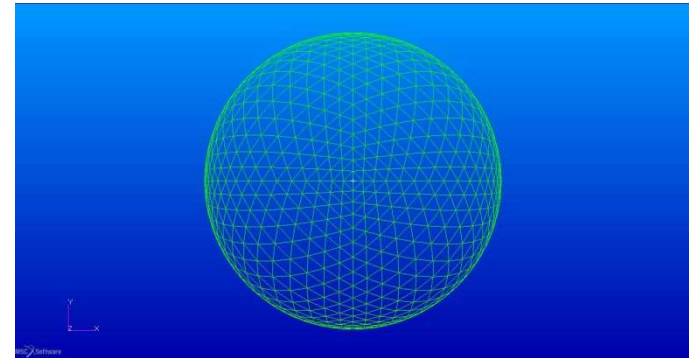

$$\text{Mass} = \frac{3}{2} \cdot \frac{4\pi}{3} R^3 \frac{p}{\left( \frac{\sigma}{\rho} \right)}$$

$\sigma$  maximum allowable stress

# Parametric Mass Model (Cont.)

- **Solution 200 of MSC.Nastran was used for all optimization**
  - Originally three solutions (strength, buckling, and normal modes) were embedded under SOL 200
- **Two Boundary conditions**
  - External pressure over all surfaces
  - Displacement constraints on four grids, orthogonal to each other, to take out three translations and three rotations
- **Objective function was set as the mass of the structure**
- **Optimization constraints...**
  - Buckling: first buckling mode
  - Strength: Von Mises stress
  - Normal Modes: First frequency higher than 7 Hz – All solutions met the frequency constraints, thus this solution was eliminated to save

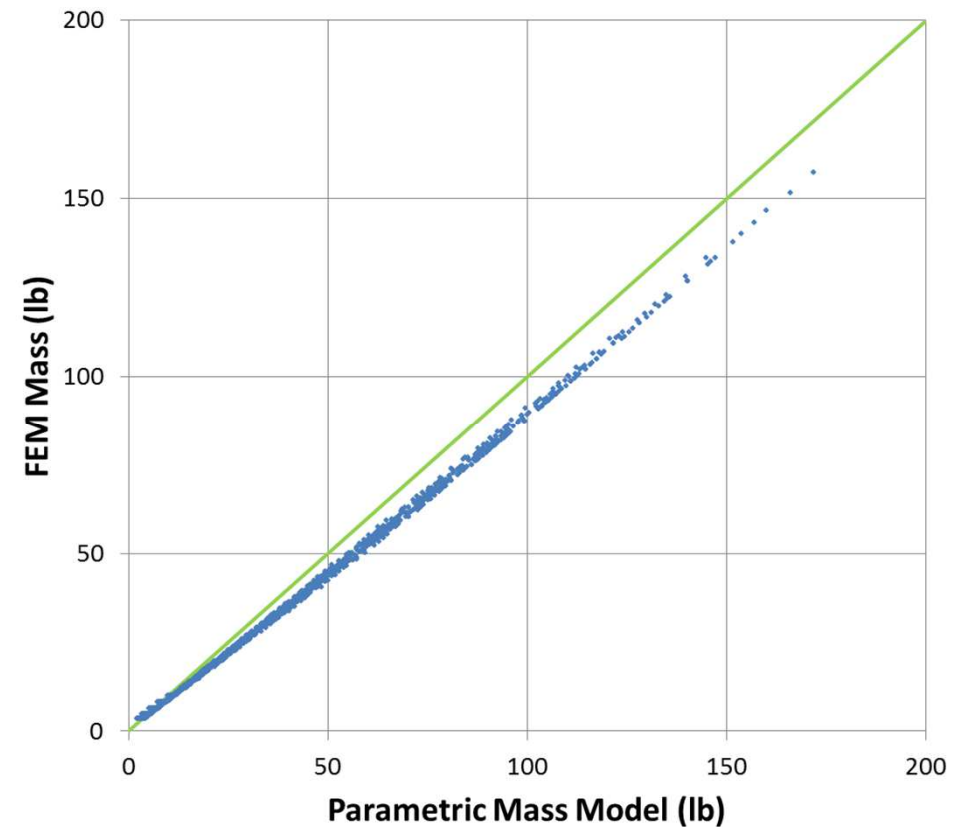

# Parametric Mass Model (Cont.)

## NASTRAN mass sizing

- 1573 cases
  - 11 Ps [700-2100 psi]
  - 13 Rs [6, 18]
  - 11 Es [8.25E6-24.8E6 psi]
- Took ~7 hours on a 12-core computer

$$\text{Parametric Mass} = \frac{3}{\sqrt{\frac{2}{3(1-\nu^2)}}} \cdot \frac{4\pi}{3} R^3 \frac{\sqrt{p}}{\left(\frac{\sqrt{E}}{\rho}\right)}$$

# Parametric Mass Model (Cont.)

$$\text{Mass} = \frac{3}{\sqrt{\frac{2}{3(1-v^2)}}} \cdot \frac{4\pi}{3} R^3 \frac{\sqrt{p*FS/K}}{\left(\frac{\sqrt{E}}{\rho}\right)} \eta,$$

$FS$  = Factor safety

$K$  = Knockdown factor

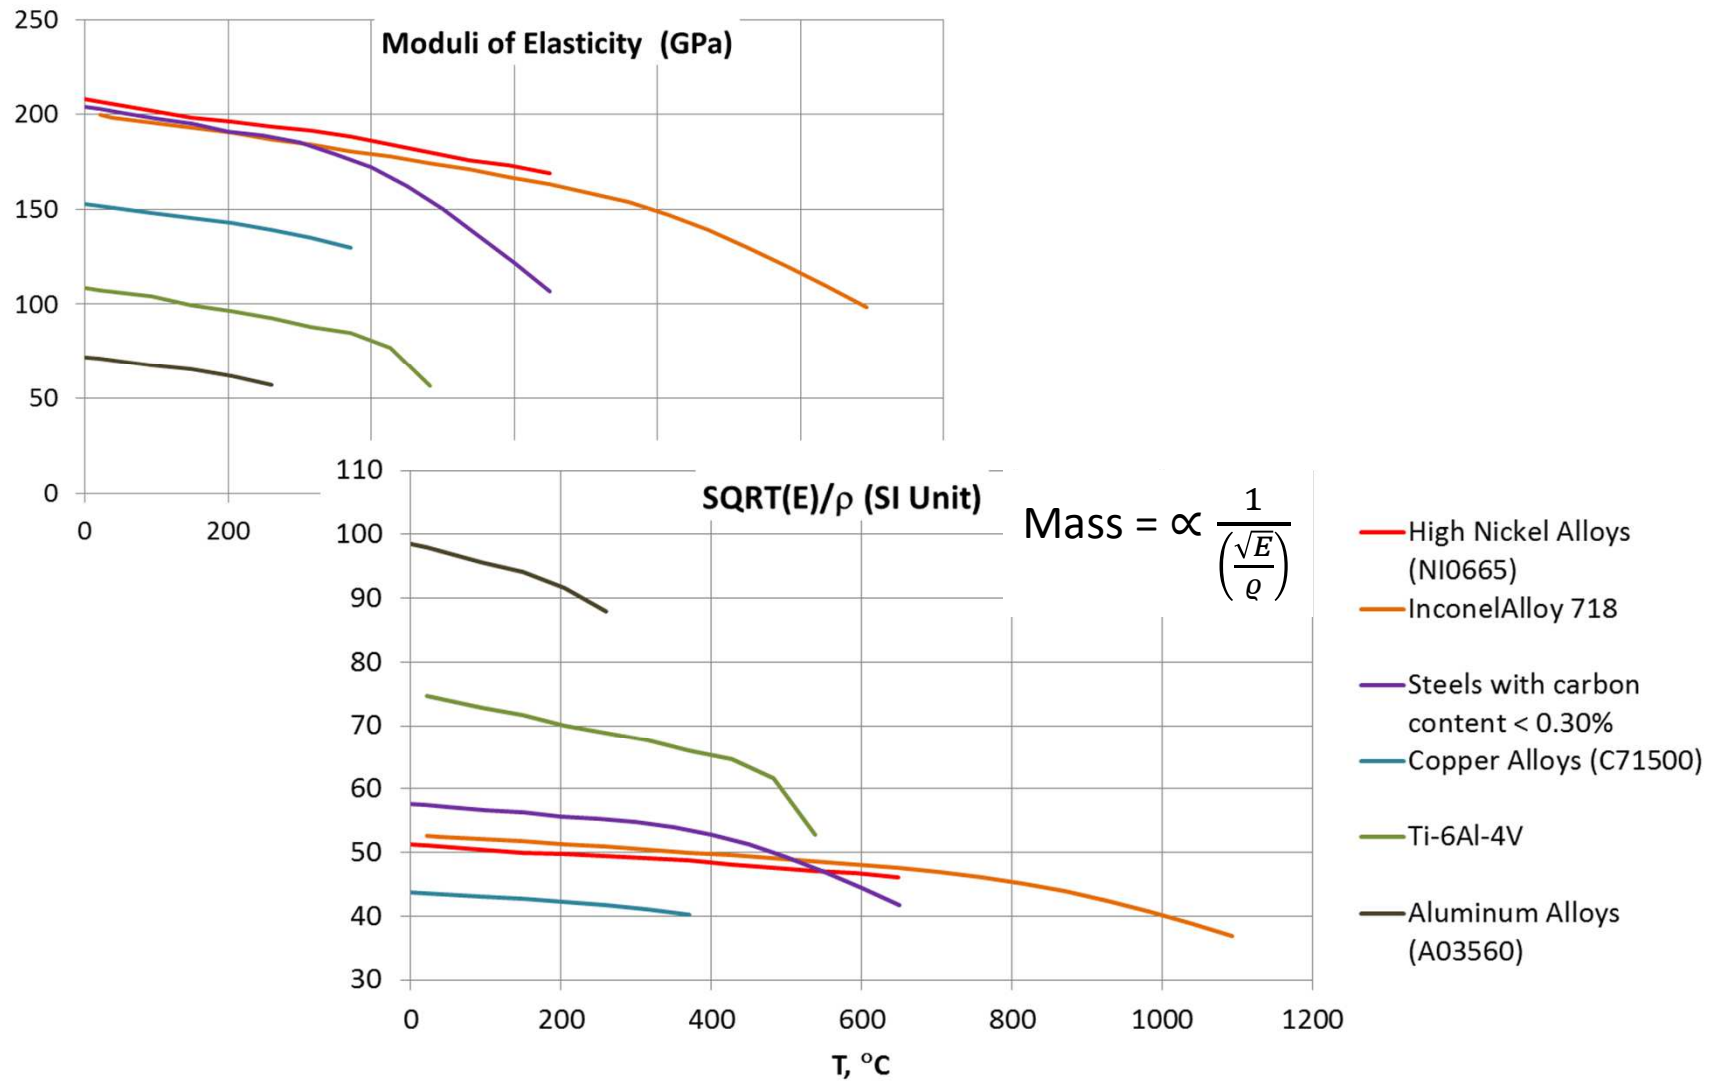

$\eta$  = Margin, MGA,....

## Pioneer Venus

	Small Probe	Large Probe
Pressure (psi)	1400	1400
E (psi)	8.25E+06	8.25E+06
R (in)	9	14.6
FS	1.25	1.25
knock-down factor (K)	0.5	0.5
Margin, MGA, ... ( $\eta$ )	1.3	1.3
$v$	0.31	0.31
$\rho$ (lb/in <sup>3</sup> )	0.163	0.163
<b>Parametric mass (lb)</b>	<b>36.3</b>	<b>154.9</b>
<b>Actual</b>	<b>40.4</b>	<b>135.7</b>
Difference (%)	10%	-14%

## Ring Stiffened Pressure Vessel (Cont.)

- A sphere stiffened by a series of rings (bars) was also studied in optimization for strength and buckling.
  - Three sets of properties for optimization of bars were considered
- The optimization with additional bars took 92 iterations using 6:08 CPU-minutes versus 4 (with only shells) using 0:15 CPU-minutes.
- The weight decrease using the additional bars was only 1.7%
- Therefore, for this stage of the studies, the bars were removed.

# Summary Remarks

- Developed a low fidelity mass model for pressure vessel that accurately represents optimized FE mass model.
- Identified appropriate figure of merit for material property suitable for pressure vessels design ( $\sqrt{E}/\rho$ ).
- Ring stiffened concept appears to have no significant advantage with current structural topology.
